```
This sequence represents the T-cell epitope derived from the HIV-1 core protein, T5, linked to a B-cell epitope, PRI which represents a consensus sequence derived from New York and Amsterdam HIV-1 isolates. Chimeric
                                                                                                                                                                                                                                                                                            T-cell; epitope; HIV-1; core protein; p24E; B-cell; antigen; gp160; gag; pol; vaccine; multimeric peptide; AIDS; 3D organisation.

The invention relates to new synthetic peptides comprising at least one amino acid sequence comprising an HIV gag protein T-cell epitope linked at the G- or N-terminus to an amino acid sequence comprising a B-cell epitope of the V3 loop of an HIV env protein, which can be used to generate vaccines against HIV-1. The T-cell epitope sequence is pref. selected from the T-halper determinant core peptides P24M, P24M, P24M, and P24H while the B-cell epitopes are derived from HIV strains including CTLB-56, V3MN, CTLB-29, CTLB-55, SF2, LAI, IIIB, RF, Z6, 2054, 1714 and BXOS The peptides are chimmeric and can be linked to a branched Lys backbone. This sequence represents a chimmeric peptide comprising the T-helper determinant core peptide TS (AAW25881) with the HIV-1 strain MN can by 1 loop B-cell epitope PRI (AAW25881) with the HIV-1 strain MN can be peptide generated from the consensus sequence of the New York and Amsterdam HIV-1 isolates. The B-cell epitope is linked to the N-terminus of the T-helper peptide. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                           ij
                These peptide sequences may also be used in the production of multimeric peptides in which the peptides are C-terminally modified by the addition of a Lys residue which is modified on its epsilon amino acid to carry an additional copy of the peptide molecule. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human or animal cells or by disturbing the 3D organisation of the virus. (Updated on 25-MMR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
  peptides such as this, may be used in the production of HIV-1 vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HIV; human immunodeficiency virus; gag; T-cell; B-cell; epitope; env; V3 loop; vaccine; determinant; chimaeric.

The T-cell epitopes are generally designed based on the p24 core protein and the B-cell epitopes from the V3 loop of the gpl20 protein from various HIV-1 extrains. This peptide corresponds to a fusion of the TS epitope (AAM67397) and the V3 loop B-cell epitope (AAM67365) which is a consensus V3 loop peptide of the New York and Amsterdam HIV-1 isolates
                                                                                                                                                                                                                                           Immunogen; vaccine; HIV-1; T-cell; B-cell; epitope; core protein; gp120;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic human immunodeficiency virus-1 peptide(s) - containing T-cell epitope and B-cell epitope(s) are candidate vaccines against HIV-1.

the immunogenic composition of the invention. The composition comprises a synthetic fusion polypeptide which includes a sequence encoding 1 or more T cell epitopes and a sequence encoding 1 or more bettopes and a carrier. Both the T cell and B cell epitopes are derived from HIV proteins. The compositions are useful as vaccines against HIV infection. The composition induces HIV-1-specific polyclonal antibodies that are opsonising and antiviral. The peptide components may be selected to induce a response against different viral isolates and in subjects who recognise different T cell epitopes. (Updated on 17-OCT-2003 to
                                                                                                                                                                                                                                                                    This sequence represents a fragment of a HIV1 protein, and can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Modified at the epsilon N with a Lys residue which is substituted on the alpha and epsilon N with the sequence given in AAR68713"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T-cell; epitope; HIV-1; core protein; p24E; B-cell; antigen; gp160; gag; pol; vaccine; multimeric peptide; AIDS; 3D organisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a synthetic peptide comprising an amino acid sequence containing a T-cell epitope of an HIV gag protein linked a its C terminus to an amino acid sequence containing a B-cell epitope of an HIV gp41 protein and containing the amino acid sequence: XILKDWX2; where XI = E, A, G or Q, and X2 = A or T, or an amino acid sequence capable of eliciting an HIV-specific antiserum and recognizing the sequence XILKDWX2. The synthetic peptide is useful in vaccines against HIV infection and in diagnostic applications. AAW98892 to AAW9896, and AAW99899 to AAW99899 represent synthetic peptides from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HIV; vaccine; immunogenic composition; T cell epitope; B cell epitope; infection; antibody; antiviral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic chimeric HIV polypeptides – comprising gag protein T-cell epitope linked to gp41 B-cell epitope.
                                                  HIV-1; human immunodeficiency virus, vaccine; T-cell epitope; gag protein; B-cell epitope; gp41 protein; chimeric; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                . 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 2; Length 33;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4
                  HIV-1 vaccine synthetic peptide SEQ ID NO:84.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24.0%; Score 46; DB

This sequence represents the T-cell epitope derived from the HIV-1 core protein, T5, linked to consesus B-cell epitope, PRI which represents a consensus sequence derived from New York and Ametradam HIV-1 isolates. Chimeric peptides such as this, may be used in the production of HIV-1 vaccines. These peptides say also be used in the production of HIV-1 multimeric peptides in which the peptides are C-terminally modified by the addition of a Lys residue which is modified on its epsilon amino acid to carry an additional copy of the peptide molecule. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human or animal cells or by disturbing the 3D organisation of the virus. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tandem synthetic HIV peptide(s) useful as immunogens - comprising gag protein T-cell epitope linked to env protein B-cell epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HIV; human immunodeficiency virus; gag; T-cell; B-cell; epitope; env; V3 loop; vaccine; determinant; chimaeric.
                                                                                                                                                                            Novel tandem synthetic HIV-1 peptide(s) - comprising T-cell epitope gag protein linked to B-cell epitope of V3 loop protein of an HIV-I isolate.

                                                                                                                                                                                                                                                                                                                                                                         contains four opies a peptide monomer comprising the T-cell spitope derived from the HIV-1 core protein, T5, linked to the B-cell spitope, PRI which represents a commsensus sequence derived from New York and Amsterdam HIV-1 isolates. The entire multimer contains four copies of the same sequence linked through Lys residues. The B-cell epitope may be derived from HIV-1 proteins esp. 19160, agg and pol proteins. These chimeric peptides may then be used in the production of HIV-1 vaccines. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human called or by disturbing the 3D organisation of the virus. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a
                 The invention relates to new synthetic peptides comprising at least one amino acid sequence comprising an HTV gag protein T-cell epitope linked at its C- or N-terminus to an amino acid sequence comprising a B-cell epitope of the V3 loop of an HIV env protein, which can be used to generate vaccines against HIV-1. The T-cell epitope sequence is pref. Selected from the T-helper determinant core peptides P24F, P24N, P24L, P24M and P24H while the B-cell epitopes are derived from HIV strains including CTLB-56, V3MN, CTLB-29, CTLB-55, SF2, LAI, IIIB, RF, Z6, 2054, T14 and BX08. The peptides are chimaeric and can be linked to a branched. Lys backbone. This sequence represents a chimaeric peptide comprising the T-helper determinant core peptide PRI which corresponds to a peptide conversion on protein V3 loop B-cell epitope PRI which corresponds to a peptide generated from the consensus sequence of the New York and Amsterdam HIV-1 strain M1 solates. The B-cell epitope is linked to the C-terminus of the T-helper beptide. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel immunogenic composition for use in vaccines for the treatment of HIV-1 comprising an HIV-1-derived T-cell epitope linked to an HIV-1-derived B-cell epitope. The T-cell epitopes are generally designed based on the p24 core protein and the B-cell epitopes from the V3 loop of the gp120 protein from various HIV-1 extrains. This peptide corresponds to a fusion of the T5 epitope (AAMG7397) and the V3 loop Becall epitope (BAMG7365) which is a consensus V3 loop peptide of the New York and Amsterdam HIV-1 isolates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunogen; vaccine; HIV-1; T-cell; B-cell; epitope; core protein; gpl20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic human immunodeficiency virus-1 peptide(s) - containing T-cell epitope and B-cell epitope(s) are candidate vaccines against HIV-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a synthetic peptide comprising an amino acid sequence containing a T-cell epitope of an HIV gag protein linked at lists C terminus to an amino acid sequence containing a B-cell epitope of an HIV gp41 protein and containing the amino acid sequence: XILKDWXZ; where XI = E, A, G or Q, and X2 = A or T, or an amino acid sequence capable of eliciting an HIV-specific antiserum and recognizing the sequence XILKDWXZ. The synthetic peptide is useful in vaccines against HIV infection and in diagnostic applications. AAW98892 to AAW98906, and AAW99899 to AAW99899 represent synthetic peptides from the present

```
contains four opples a peptide monomer comprising the T-cell epitope derived from the HIV-1 core protein, T5, linked to the B-cell epitope, PRI which represents a commsensus sequence derived from New York and Amsterdam HIV-1 isolates. The entire multimer contains four copies of the same sequence linked through lys residues. The B-cell epitope may be derived from HIV-1 proteins esp. 19160, agg and pol proteins. These chimeric peptides may then be used in the production of HIV-1 vaccines. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human calls or by disturbing the 3D organisation of the virus. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS
                                                                                                                   /note= "Modified at the epsilon N with a Lys residue which is substituted on the alpha and epsilon N with the sequence given in AAR68712"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel tandem synthetic HIV-1 peptide(s) - comprising T-cell epitope of gag protein linked to B-cell epitope of V3 loop protein of an HIV-I isolate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a fragment of a HIVI protein, and can be used in synthetic fusion polypeptide which includes a sequence encoding 1 or more T cell epitopes and a sequence encoding 1 or more T cell epitopes and a sequence encoding 1 or more B cell epitopes and a sequence encoding 1 or more B cell epitopes and a proteins. The compositions are useful as vaccines against HIV infection. The composition induces HIV-1-specific polyclonal antibodies that are opsonising and antiviral. The peptide components may be selected to induce a response against different viral isolates and in subjects who standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T-cell; epitope; HIV-1; core protein; p24E; B-cell; antigen; gp160; gag; pol; vaccine; multimeric peptide; AIDS; 3D organisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic composition containing synthetic fusion polypeptides containing both the T and B cell epitopes of the human immunodeficiency virus, useful antigens in producing vaccines.

                                                                                                                                                                                                                                                                                       Peptide RPI50 comprises segments of the Principal Neutralising Domain (envelope protein) from isolate AVR-2. The last Cys residue is added for the purpose of crossfliking to carrier proteins. Cysteine residues may be added, so that the residues at or near both ends form a disulfide bond, giving peptide a loop-like configuration, which can be utilised to enhance the immunogenic properties of the peptides. Protein is capable of eliciting, and/or binding with, neutralising Abs. The neutralising domain is bounded by cysteine residues which occur at positions 296 and 331. Peptides can be used as immunogens or screening reagents to generate or identify poly- or monoclonal antibodies. See also ARR04427-R04506 and AAQ04273-Q0450. The products of the invention have anti-viral and anti-HIV activity. Mixtures of structurally different viral proteins, that are sequence variants of a single protein are useful for production of vaccines for the prevention and/or therapy of viral infections in humans. The vaccines are especially useful for prevention and/or therapy of human immunodeficiency virus (HIV) infection in humans. The vectors and host cells are useful for the expression of the protein/DNA mixtures, which are also useful for preventing and/or therapy of viral infection. This sequence represents a gpl20 protein V3 loop fragment from HIV-1 isolate PI-932. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                           Viral vaccine comprises a mixture of protein sequence variants of a single viral protein, which is useful for prevention and therapy of viral infections, especially HIV, in humans.

Identifying compounds that modify interaction of gpl20 and co-receptors, useful potentially for treating human immune deficiency virus infection, also new peptides.
```

Disclosure, Fig 2; 68pp; German.

This invention describes novel substances that modify the interaction between the gpl20 protein of human immunodeficiency virus (HIV), or its fragmants, with the co-receptors CXCR4, CCR5 and/or other 7-helix transmembrane receptors for HIV. The method comprises (a) immobilizing a ligand for the co-receptor on a gold surface; (b) contacting the ligand with suspended cells that express the co-receptor; and (c) determining interaction by measuring the refractive index (RI) by plasmon resonance. The procedure is repeated using cells that have been incubated with a test compound, and this is identified if RI is lower for cells for preincubated with a test compound, and this is identified if RI is lower for cells that includes the amino acid sequence of an HIV v3 loop (including flanking Cys). The products of the invention have virucide and anti-HIV and/or treatment of HIV infection. This sequence represents an HIV-1 v3-loop region described in the disclosure of the invention. Sequence 83, Application US/08465217A

Patent No. 5800822

GENERAL INFORMATION:
APPLICANT: SIA, Charles D.Y.
APPLICANT: CHONG, Pele
APPLICANT: CHONG, Pele
APPLICANT: Anothel H.
TITLE OF INVENTION: Tandem Synthetic HIV-1 Peptides
NUMBER OF SEGUENCES: 101
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sim & McBurney
STREET: Suite 701, 330 University Avenue
CITY: Toronto
STATE: Ontario
COUNTRY: Canada
ZIP: MSG 1R7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               COMPUTER READABLE FORM:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Identification of tissue-specific isoforms for subunits Vb and VIIa of cytochrome c oxidase isolated from rainbow trout.";

Eur. J. Blochem. 221:1111-1116(1994).
-!- FUNCTION: This protein is one of the nuclear-coded polypeptide chains of cytochrome c oxidase, the terminal oxidase in mitochondrial electron transport.
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-0CT-1994 (Rel. 30, Created)

Result

This sequence represents a fragment of novel human chondrocyte integrin subunit alpha-10 (1Sal0, see AAY32242), corresponding to the C-terminal cytoplasmic domain of the protein. The invention relates to a recombinant or isolated integrin heterodimer comprising the alpha10 subunit in association with subunit beta (especially beta-1). The integrin heterodimer, or the subunit alpha-10, or a fragment of it such as the present sequence, can be used as a marker or target of all types of cells, e.g. of chondrocytes, osteoblasts and fibroblasts. They can also be used: for treating pathological conditions involving ISal0, such as damage to cartilage, trauma, rheumatoid arthritis or osteoarthritis; for

New isolated integrin subunit alpha-10, used as a marker or target molecule for cells during development, regeneration and pathological conditions, e.g. arthritis, osteoarthrosis, cancer, atherosclerosis

Thu

Leukine, where the polyanionic polymer is polyglutamic acid or polyaspartic acid; (3) a vector (III) comprising a cassette which comprises a nucleotide sequence encoding a polyanionic polymer and at least one other nucleotide sequence, where the polyanionic polymer is polyglutamic acid or polyaspartic acid; (4) production of (I); (5) a cell (IV) comprising (II) or a vector that comprises a nucleotide sequence that encodes a polyanionic polymer that is larger than 10 kDs, and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease or ailment in an individual by administering (I) to the individual. (I) is also useful for delivering an effective amount of a pharmaceutically active agent, a therapeutic protein or a drug to a patient in need of it, or for diagnostic and testing or research purposes. AB2222045 to AB222131 and ABB56374 to ABB56400 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a peptide with a series of heptadrepats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats.

The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 kD. (M) involves inserting into an expression vector (EV) a ligation product formed by ligating together oligonucleotides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating the protein product (P) of EV, where (P) is PP and at least 80% of PP is approximately of the same molecular weight. Also described: (1) a recombinant fusion protein (I) comprissing a polyanionic polypeptide and another polypeptide at either one end or at both ends of it; (2) a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a peptide with a series of heptadrepeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation, thrombosis and malignancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amino acid sequence of a peptide from the integrin beta-3-subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; integrin beta-3-subunit; inhibition; cellular adhesion; cell adhesion regulatory domain; CARD; tumour; inflammatory refibroblast proliferation; coronary disease; vascular disease; respiratory distress syndrome; retinosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAR88078 represents the human integrin alpha-IIb cytoplasmic domain. It is used to produce a Tac/integrin chimera having the cytoplasmic domain as above covalently linked to the extracellular and transmembrane domain of the Tac subunit of the human interleukin-2 receptor. Chimeric integrins can be used to block the activity of natural integrins in vivo. This provides an alternative route, to using small molecule inhibitors of ligand binding by integrins, of studying and modulating integrin activity in vivo. These inhibitors act on the interaction between intracellular molecules and integrins and are therefore likely to be cell type-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New soluble protein models of transmembrane receptors - have helical amphiphilic sequence to represent transmembrane domain, also chimeric integrin proteins for inhibiting human cellular integrins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The invention relates to an isolated nucleic molecule that is at least CC 95% identical to 18 human cDNA sequences representing 12 novel genes cenced proteins or a polymuclecide fragment of the cDNA.

CC defined in the specification, its species homologue, a variant or allelic variant of the polymuclecide having a homologue, a variant or allelic variant of the polymuclecide capable of hybridising under conditions the polymuclecide, where the polymuclecide capable of hybridising under conditions the polymuclecide, where the polymuclecide conditions to a nucleic acid molecule companies under stringent conditions to a nucleic acid molecule capabinant vectors, host cells for producing the polympetide, the secreted polypeptide fragment, domain, epitope full-length protein, variant, allelic variant or species homologue), antibodies that secreted polypeptide fragment, domain, epitope full-length protein, variant of the polypeptides, diagnosing treating, preventing or ameliorating amedical condition by administering the polymuclectide or the polypeptide, the gene corresponding to the cDNA sequence and sequence in a cell, isolating the supernatant, and detecting an activity or in a biological seasy and identifying the protein in the supernatant or pathological condition, for preventing, treating, or ameliocating a condition, such as cancer, inflammation and other immune condition, such as cancer, inflammation and other immune condition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for contrasses or decrease storage capabilities, fat contracts or other contrasses or decreases storage capabilities, and public proper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  subunit. The present sequence is the Integrin alpha cytoplasmic domain motif as found in the gene7 protein
                                                                                                                                                                                                                                                                                                                                                      New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 34.2%; Score 39; DB 6; Le 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of a peptide from human integrin beta-3-subunit, which is used in the method of the invention. This method shrotoves the inhibition of cellular adhesion, which the use of peptides comprising a cell adhesion regulatory domain (CARD) of an adhesion receptor abunit expressed by the cell. The method is useful in treatments requiring inhibition of cellular adhesion e.g. to prevent growth of tumours, since adhesion is required to form tumour masses. It can be used to inhibit cellular inflammatory responses, (especially when the CARD is an integrin beta or alpha subunit), and to the peptide comprises an integrin beta is CARD. The method is useful to treat excessive fibroblast proliferation (especially to heal wounds) when the peptide comprises an integrin beta is CARD. The method is useful to treat coronary and/or vascular diseases, as well as respiratory distress syndrome, and retinosis in the blood
                                                                                                                                                                                                                                                                             Inhibiting cellular adhesion useful e.g. to prevent tumour growth - by introducing peptide(s) comprising cell adhesion regulatory domain of an adhesion receptor or counter receptor sub-unit expressed by the cell.

                                                                                                                                                                                                                                                                                                                     The invention relates to a marker (I) for mammalian mesenchymal stem cells (MSC), comprising an integrin alpha10 and/or integrin alpha11 chain userpressed on cell surface of a MSC or intracellular in a MSC. (I) is useful for identification of a mammalian MSC, for modulating differentiation of a mammalian MSC, for solating a mammalian MSC is useful for identifying, differentiating and isolating amammalian MSC from a mixed cell population as useful tools in cell therapy or in repair of damage tissue. The present sequence represents a sequence from the integrin alpha10 cytoplasmic domain which is present in the place of a conserved integrin cytoplasmic domain motif (ADI39444).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                          Marker for mammalian mesenchymal stem cells, useful for identifying and isolating mesenchymal stem cells, comprising integrin alpha 10 and/or integrin alpha 11 chain expressed on surface or within the stem cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulat activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for cliciting humoral or callular immune response. The polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal course as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancercus tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP813646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                         Mitchell SC;

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has eytoetatic and immunostimulat activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for claracterising cytogenetic abnormalities of this chromosomal colours, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in the chromosomal region that encodes 121P2A3 that may contribute to comparating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP835646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                             New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Challita-Bid PM, Raitano AB, Faris M, Hubert RS, Mitchell SC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                         The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has extosette and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for caracterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities of in the chromosomal region that encodes 121P2A3 that may contribute to an alignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The pricing are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                         New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

                                                                                                                                                                                                                                                                                                                                                                        modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for eliciting humoral or cellular immunostimulatices. The polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83546 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                              The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polynucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This is the amino acid sequence of a lung tumour associated peptide. This patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a polynucleotide encoding a lung tumour protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cancer; lung tumour; cytostatic; vaccine; T cell expansion;

the specification, or a sequence (S2) mentioned in specification, or a sequence service (S2) mentioned in specification, or a sequence consisting of at least 20 contiguous residues of S1, sequences having 75%, preferably cof S1, sequences har hybridise to S1, sequences having 75%, preferably cof S1, sequences har hybridise to S1. Also included are an isolated polypeptide (comprising a sequence (S3) selected from any one of the 4 maino acid sequences mentioned in the specification, a sequence moded by the polymorlectide, or sequences having at least 70%, preferably 90%, identify to a sequence encoded by the polymorlectide, an expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that the vector, an isolated antibody (or its antigen-binding fragment) that the operation control sequence, a host cell transformed or transfected with the operations, attainable to an appecifically binds to the polypeptide, detecting the polypeptide, an expression control sequence, a host cells specific for a tumour conditions, etimulating and/or expanding T cells specific for a tumour or antigen-presenting cells, under conditions and for a time sufficient comprising contacting T cells with the polymorlectide, protein contacting cells, under conditions and for a time sufficient contacting cells that express the polymorlectide, such that T cells for expanding to the patient with the polymorlectide, protein or antigen presenting cells that express the polymorlectide, such that T cells for presenting cells that express the polymorlectide, such that T cells composition for simulating an immune response in a patient, and for the patient the presence of a cancer in a composition for simulating an immune response in a patient, and thus immune response to the patient. The protein and oligomorlectide is also useful in pharmaceutical compositions, e.g. vaccines. The polymorlectide is a sequence of a cancer in a patient per presence of a cancer in a patient per 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          library. The present sequence is an epitope mapping peptide derived from the cDNA L548S isolated from a library derived from lung tumour/cancer cells. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
a sequence selected from any of the 14 sequences mentioned in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polypeptide associated with the compositions and methods for the therapy and diagnosis of lung cancer
                                                                                                                                                                                                                                                                                                       New polynucleotide, useful for preparing a composition for treating or inhibiting development of cancer, e.g. lung cancer.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
